

ASSIGNMENT 3

Submit your GitHub repository link before at 00:00 AM to: kamatekatende@gmail.com

Bring your hardcopy(printed or handwritten tomorrow at 8:30AM)

QUESTION1.

Create a function that swaps two numbers using pointers.

QUESTION 2.

Design and implement a **STUDENT MANAGEMENT SYSTEM** in C++ using: functions, header files (.h) , source files (.cpp) , a main program file.

Your program should allow the user to: add a student, display all students, search for a student by ID, update student information , delete a student, exit the program.

Requirements

A. Create the following structure: main, student.cpp and student.h

B. Define a Student Structure

Inside student.h, create a structure named Student containing:

- Student ID
- Name
- Age
- Course

Example:

```
struct Student {  
    int id;  
    string name;
```

```
int age;  
string course;  
};
```

C. Declare the Following Functions

In student.h, declare functions such as:

```
void addStudent();  
void displayStudents();  
void searchStudent();  
void updateStudent();
```

D. Implement the Functions

In student.cpp, write the definitions of all functions.

Each function should perform its corresponding task.

E. Main Program

In main.cpp:

- Display a menu repeatedly using loops
- Call the appropriate function depending on the user's choice
- End only when the user selects Exit
